# ZYGMUND CLASSES WITH BOUNDARY CONDITIONS AS INTERPOLATION SPACES Paolo Acquistapace

#### 0. INTRODUCTION

This paper is concerned with the characterization of the real interpolation spaces  $\{D_A, E\}_{\alpha,\infty}$  [Lions-Peetre, 1964] and  $(D_A, E)_{\alpha}$  [Da Prato-Grisvard, 1979], where A is an elliptic differential operator of order 2m, with general boundary conditions, and E is the Banach space of continuous functions on a bounded open set  $\Omega \subseteq \mathbb{R}^n$ ; following [Grisvard, 1969], we denote such spaces respectively by  $D_A(\theta,\infty)$  and  $D_A(\theta)$ , where  $\theta = 1-\alpha$ .

In an earlier paper [Acquistapace-Terreni, 1987] we studied the case  $2m\theta \notin \mathbb{N}$ ; the purpose here is to study the "critical" cases  $2m\theta = q \in \mathbb{N}$ . All notations here are the same as in [Acquistapace-Terreni, 1987].

### 1. ASSUMPTIONS

Let  $\Omega$  be a bounded open set of  $\mathbb{R}^n$ ,  $n\geq 1$ , with  $c^{2m}$  boundary,  $m\geq 1$ . We introduce the differential operators

1.1) 
$$A(x,D) := \sum_{\alpha \in \Omega} a_{\alpha}(x) D^{\alpha}, \quad x \in \overline{\Omega}$$

$$(1.2) \qquad B_{j}(x,D) := \sum_{\beta \mid \beta \mid = m_{j}} b_{j\beta}(x)D^{\beta} , \quad x \in \partial\Omega , \quad j = 1,...,m,$$

under the following assumptions:

(1.3) 
$$a \in C(\overline{\Omega}, \mathbf{c}) , |\alpha| \leq 2m ; b \in C$$
 
$$(\partial\Omega, \mathbf{c}) , |\beta| \leq m , j = 1, \dots, m$$

$$(1.4) \quad \text{(ellipticity) There exist } \eta \in [0,2\pi\,[\text{ , $\nu$>0 such that} \\ \nu \, (|\xi|^{2m} + t^{2m}) \leq \Big| \sum_{|\alpha| = 2m} a_{\alpha}(x) \, \xi^{\alpha} - (-1)^m e^{i\eta} t^{2m} \Big| \quad \forall x \in \overline{\Omega}, \; \forall \xi \in \mathbb{R}^n \,, \; \forall t \in \mathbb{R}.$$

(1.5) (root condition) If  $x \in 3\Omega$ ,  $\xi \in \mathbb{R}^n$ ,  $t \in \mathbb{R}$  and  $|\xi| + |t| > 0$ ,  $(\xi | v(x)) = 0$ , then the polynomial

$$\zeta \mapsto \sum_{\alpha = 2m} a_{\alpha}(x) (\xi + \zeta v(x))^{\alpha} - (-1)^{m} e^{i\eta} t^{2m}$$

has exactly m roots  $\zeta_{j}^{+}(x,\xi,t)$  with positive imaginary part.

(1.6) (complementing condition) If  $x \in \partial \Omega$ ,  $\xi \in \mathbb{R}^n$ ,  $t \in \mathbb{R}$  and  $|\xi| + |t| > 0$ ,  $(\xi |v(x)) = 0$ , then the m polynomials

$$\zeta \mapsto \sum_{|\beta|=m_i} b_{j\beta}(x) (\xi+\zeta v(x))^{\beta}$$

are linearly independent modulo the polynomial

$$\zeta \Rightarrow \prod_{j=1}^{m} (\zeta - \zeta_{j}^{\dagger}(x, \xi, t)).$$

(1.7) 
$$0 \le m \le m \le 2m-1$$
 if  $1 \le j \le i \le m$ .

REMARK 1.1. Condition (1.7) replaces here the normality condition assumed in [Acquistapace-Terreni, 1987].

Indeed, it is easily seen that the transversality condition ((1.9) of that paper), i.e.

$$\sum_{\left|\beta\right|=m_{j}}b_{j\beta}(x)v(x)^{\beta}\neq0\text{ , }x\in\partial\Omega\text{ , }j=1,\ldots,m$$

is implied by the complementing condition (1.6); thus the only difference here with respect to [Acquistapace-Terreni, 1987] is that we just require the orders of the boundary operators to be less than 2m, without forcing them to be different from one another.

We remark that this weakened form of the normality condition is sufficient to prove all results of [Acquistapace-Terreni, 1987]: actually, the proof of the main result there [Theorem 2.3] depends only on the

basic elliptic existence theory and spectral estimates [Theorems 1.1-1.2 of that paper] which in turn still hold under these assumptions, as shown in [Geymorat-Grisvard, 1967, Theorem 4.1].

Under hypotheses (1.1),...,(1.7) the abstract operator A, defined in the space  $E:=C(\overline{\Omega})$  by

$$(1.8) \begin{cases} D_{A} := \{ u \in \bigcap W^{2m, p}(\Omega) : A(\cdot, D)u \in C(\overline{\Omega}), B_{j}(\cdot, D)u = 0 \text{ on } \partial\Omega \\ p \in [1, \infty[ & \text{for } j = 1, \dots, m \}, \\ Au := A(\cdot, D)u \end{cases}$$

is the infinitesimal generator of an analytic semigroup in E [Stewart, 1980]; in particular, possibly replacing  $A(\cdot,D)$  by  $A(\cdot,D)-\omega I$  ( $\omega>0$ ) we may assume that

$$(1.9) \quad \rho(\mathtt{A}) \supseteq \left\{ \lambda \in \mathfrak{C} \colon \mathrm{Re} \ \lambda > 0 \right\} \ , \quad \left\| \, \mathbb{E}\left(\lambda, \mathtt{A}\right) \right\|_{L\left(\mathrm{E}\right)} \ \le \ \frac{M}{|\lambda|} \ \text{if} \quad \mathrm{Re} \ \lambda > 0 \, .$$

Hence the spaces  $D_{\widehat{A}}(\theta,\infty)$  and  $D_{\widehat{A}}(\theta)$  can be characterized [Grisvard, 1969] by:

$$\begin{array}{lll} \text{(1.10)} & \mathbb{D}_{\mathbb{A}}(\theta,\infty) = \{ \mathbf{x} \in \mathbb{E} \ : \ [ \ \mathbf{x} \ ]_{\mathbb{A}}(\theta,\infty) & := \sup & \mathbf{s}^{\theta} \| \operatorname{AR}(\mathbf{s},\mathbb{A}) \, \mathbf{x} \|_{\mathbb{E}} < \infty \}, \\ & \mathbb{D}_{\mathbb{A}}(\theta,\infty) & \mathbb{S} \geq 1 \end{array}$$

(1.11) 
$$D_{\mathbf{A}}(\theta) = \{ \mathbf{x} \in D_{\mathbf{A}}(\theta, \infty) : \lim_{\mathbf{x} \uparrow \infty} \mathbf{s}^{\theta} \| \mathbf{A} \mathbf{R}(\mathbf{s}, \mathbf{A}) \mathbf{x} \|_{\mathbf{E}} = 0 \}$$
.

#### 2. PRELIMINARIES AND THE MAIN RESULT.

We list here some preliminary results which are necessary in order to state our main theorem. First of all we define the Zygmund classes: if  $\Omega^{\mathbb{CR}^n}$  is an open set, we define for  $q \in \mathbb{N}^+$ :

(2.1) 
$$\Lambda^{\mathbf{q}}(\overline{\Omega}) := \{ \mathbf{f} \in \mathbf{C}^{\mathbf{q}-1}(\overline{\Omega}) : [\mathbf{f}] \}_{\Lambda^{\mathbf{q}}(\overline{\Omega})}$$

$$:= \sum_{|\alpha|=q-1} \sup \left\{ \frac{\left| D^{\alpha} f(x) + D^{\alpha} f(y) - 2D^{\alpha} f((x+y)/2) \right|}{\left| x - y \right|} : x, y, \frac{x+y}{2} \in \widehat{\Omega} \right\} < \infty,$$

(2.2) 
$$\lambda^{\mathbf{q}}(\overline{\Omega}) := \{ \mathbf{f} \in \Lambda^{\mathbf{q}}(\overline{\Omega}) : \lim_{r \to 0} \sup_{\mathbf{x} \in \overline{\Omega}} [\mathbf{f}] = 0 \}$$

where the space  $C^{q-1}(\overline{\Omega})$  consists of functions whose derivatives of order  $|\alpha| \leq q-1$  are uniformly continuous and bounded in  $\overline{\Omega}$ . It is well known that  $\Lambda^q(\mathbb{R}^n)$  can be described in an alternative way [Triebel, 1978, Theorem 2.7.2/2]:

$$(2.3) \quad \Lambda^{q}(\mathbb{R}^{n}) = \{ f \in C(\mathbb{R}^{n}) : \sup \{ |h|^{-q} | (\Lambda_{h}^{q+1} f)(x)| : h \in \mathbb{R}^{n} - \{0\}, x \in \mathbb{R}^{n} \} < \infty \},$$

where

(2.4) 
$$(\Delta_h^{q+1}f)(x) := \sum_{j=0}^{q+1} (-1)^{q+1-j} {q+1 \choose j} f(x+jh).$$

Moreover we have the proper inclusions

$$C^{q}(\overline{\Omega}) \hookrightarrow \operatorname{Lip}^{q}(\overline{\Omega}) \hookrightarrow \Lambda^{q}(\overline{\Omega}) \hookrightarrow C^{\alpha}(\overline{\Omega}) \text{ if } 0 < \alpha < q \text{ and } q \in \mathbb{N}^{+},$$

provided  $\partial\Omega$  is of class  $C^1$ .

It will be useful the following extension property:

PROPOSITION 2.1. If  $\Omega$  is bounded with  $\partial\Omega \in \mathbb{C}^q$ , then there exists an extension operator  $E: \Lambda^q(\overline{\Omega}) \to \Lambda^q(\mathbb{R}^n)$  such that:

(i) Ef 
$$\equiv$$
 f,

(ii) Ef has compact support in Rn

This result holds under much more general assumption [Jonsson-Wallin,

5

1979, Theorem 5.1], but when  $\partial\Omega\in C^{\mathbf{q}}$  it is possible to give an easier proof, which we omit for brevity.

We now turn to some interpolation properties.

PROPOSITION 2.2. If  $\Omega$  is bounded with  $\partial \Omega \in C^{\overline{q}}$ , then

$$\Lambda^{\mathbf{q}}(\widetilde{\Omega}) = (C^{\mathbf{q}+\epsilon}(\widetilde{\Omega}), C^{\mathbf{q}-\epsilon}(\widetilde{\Omega})) \qquad \forall \epsilon \in ]0,1]$$

<u>Proof.</u> The case  $\partial\Omega \in \mathbb{C}^{\infty}$  is proved in [Triebel, 1978, Theorem 4.5.2/1]. Let  $f \in \Lambda^{\mathbf{q}}(\overline{\Omega})$ . By Proposition 2.1, we extend f to a function  $F \in \Lambda^{\mathbf{q}}(\mathbb{R}^n)$ . As, by [Triebel, 1978, Theorem 2.7.2/1],

$$\Lambda^{\underline{q}}(\mathbb{R}^n) = (c^{\underline{q}+\varepsilon}(\mathbb{R}^n), c^{\underline{q}-\varepsilon}(\mathbb{R}^n))_{1/2,\infty},$$

we have,by definition, F=U(0, $\circ$ ), where U: $]0,1] \rightarrow C^{q+\epsilon}(\mathbb{R}^n)$  satisfies

$$\sup_{t\in [0,1]} t^{1/2} \{ \| \mathbf{U}(t) \|_{\mathbf{C}^{\mathbf{q}+\epsilon}(\mathbb{R}^n)} + \| \mathbf{U}'(t) \|_{\mathbf{C}^{\mathbf{q}-\epsilon}(\mathbb{R}^n)} \} \leq \kappa.$$

Hence  $u(t):=U(t)\left|_{\widehat{\Omega}}\right|$  satisfies the same inequality with  $\mathbb{R}^n$  replaced by  $\widehat{\Omega}$ , and u(0)=f. Thus  $f\in (C^{q+\epsilon}(\widehat{\Omega}),C^{q+\epsilon}(\widehat{\Omega}))_{1/2,\infty}$ . Conversely, let  $f\in (C^{q+\epsilon}(\widehat{\Omega}),C^{q-\epsilon}(\widehat{\Omega}))_{1/2,\infty}$ . Then f=u(0), with u(t) satisfying

(2.5) 
$$\sup_{\mathbf{t}\in ]0,1]} \mathbf{t}^{1/2} \{ \|\mathbf{u}(\mathbf{t})\|_{\mathbf{C}^{\mathbf{q}+\mathbf{\epsilon}}(\overline{\Omega})} + \|\mathbf{u}'(\mathbf{t})\|_{\mathbf{C}^{\mathbf{q}-\mathbf{\epsilon}}(\overline{\Omega})} \} \leq K_{\mathbf{f}}$$

Let now  $|\alpha|=q-1$  and fix x,y,  $\frac{x+y}{2}\in\Omega$ . If  $\Omega$  is convex, we write

$$\begin{split} \left| D^{\alpha} f(x) + D^{\alpha} f(y) - 2D^{\alpha} f((x+y)/2) \right| &\leq \left| \left[ \Delta_{\frac{y-x}{2}}^{2} D^{\alpha} (f-u(t, \cdot)) \right](x) \right| \\ &+ \left| (\Delta_{\frac{y-x}{2}}^{2} D^{\alpha} u(t, \cdot))(x) \right| = \left| \int_{0}^{\infty} \left[ \Delta_{\frac{y-x}{2}}^{2} D^{\alpha} u_{s}(s, \cdot) \right](x) ds \right| \\ &+ \left| \int_{0}^{1} (\nabla D^{\alpha} u(t, \frac{x+y}{2} + s \frac{x-y}{2}) - \nabla D^{\alpha} u(t, \frac{x+y}{2} - s \frac{x-y}{2}) \right| \frac{x-y}{2} ds \right| \\ &\leq c K_{f} |x-y|^{1-\epsilon} t^{1/2} + c K_{f} |x-y|^{1+\epsilon} t^{-1/2} , \end{split}$$

and choosing t =  $(\frac{|\mathbf{x}-\mathbf{y}|}{\text{diam }\Omega})^{2\epsilon}$  we obtain  $f \in \Lambda^{\mathbf{q}}(\overline{\Omega})$ . If  $\Omega$  is not convex we

have to construct two  $C^1$  curves contained in  $\Omega$ , joining  $\frac{x+y}{2}$  to x and y, and whose lengths do not exceed M|x-y|, where M depends only on  $\Omega$ ; this can be done since  $\partial\Omega$  is of class  $C^1$  at least, as shown in [Acquistapace-Terreni, 1984, Lemma 1.16]. Then we can repeat the preceding argument, by integrating along such curves, and the result follows as above.

PROPOSITION 2.3. Let  $\Omega$  be a bounded open set with  $\partial \Omega \in \mathbb{C}^{k+1}$ ,  $k \in \mathbb{N}^+$ .

$$\|\mathbf{f}\|_{\mathbf{C}^{k}(\partial\Omega)} \leq \underset{\mathbf{C}}{\mathbb{M}_{\Omega}} \|\mathbf{f}\|_{\mathbf{C}^{k+1}(\partial\Omega)}^{1/2} \|\mathbf{f}\|_{\mathbf{C}^{k-1}(\partial\Omega)}^{1/2} , \forall \mathbf{f} \in \mathbf{C}^{k+1}(\partial\Omega).$$

This estimate is also well known.

Let us go back now to the situation described in Section 1. As  $\partial\Omega\in \mathbb{C}^{2m}$ , the distance function

(2.6) 
$$d(x) := \inf\{|x-y| : y \in \partial \Omega\}, x \in \overline{\Omega}$$

belongs to  $C^{2m}((\partial\Omega)_r)$ , when  $(\partial\Omega)_r := \{x \in \overline{\Omega} : d(x) \le r\}$  and r is a suitable positive number; in addition  $\nabla d = -\nu$  on  $\partial\Omega$ , where  $\nu(x)$  is the unit outward normal vector at  $x \in \partial\Omega$  (see [Gilbarg-Trudinger, 1977, Appendix]): hence  $\nu \in C^{2m-1}(\partial\Omega, \mathbb{R}^n)$ .

We want now to define suitable subspaces of  $\Lambda^{\mathbf{q}}(\Omega)$  determined by some kind of boundary conditions. We start with considering, for fixed j, the boundary operator  $B_{\mathbf{j}}(\mathbf{x},D)$  defined in (1.2). For each  $\gamma\in\mathbb{N}^n$  with  $|\gamma|=m_{\mathbf{j}}$  we set

 $N(\gamma):= \text{number of non-zero components of } \gamma =$   $= \text{ cardinality of } \{\beta \in \mathbb{N}^n: \left|\beta\right| = m_j - 1, \ \beta + e^i = \gamma \text{ for some } i=1,\dots,m\}.$  Hence we have, denoting by  $B_i$  the principal part of  $B_j$ :

$$[(2.7) \quad \overline{B}_{j}(x,D)u = \sum_{|\gamma|=m_{1}} b_{j\gamma}(x)D^{\gamma}u(x) =$$

$$= \sum_{\substack{\beta \mid = m_{j}-1 \\ \beta \mid = m_{j}-1}} \sum_{i=1}^{n} [N(\beta + e^{i})]^{-1} b_{j,\beta + e^{i}}(x) D^{\beta} D_{i} u(x)$$

Set now for  $|\beta| = m - 1$  and i = 1, ..., n

(2.8) 
$$e^{j,\beta}(x) := \{e_{i}^{j,\beta}(x)\}_{1 \le i \le n} ; e_{i}^{j,\beta}(x) := [N(\beta + e^{i})]^{-1}b_{j,\beta + e^{i}}(x),$$

$$Te^{j,\beta}(x) := e^{j,\beta}(x) - (e^{j,\beta}(x))v(x).$$

Then we can rewrite  $B_{\frac{1}{2}}(x,D)u$  as:

$$(2.9) \quad \overline{B}_{j}(\mathbf{x}, \mathbf{D})\mathbf{u} = \sum_{\left|\beta\right| = \mathbf{m}_{j} - 1}^{n} \sum_{\mathbf{i} = 1}^{n} \mathbf{c}_{\mathbf{i}}^{j, \beta}(\mathbf{x}) \mathbf{D}^{\beta} \mathbf{D}_{\mathbf{i}} \mathbf{u}(\mathbf{x}) =$$

$$= \sum_{\left|\beta\right| = \mathbf{m}_{j} - 1}^{n} (\mathbf{c}^{j, \beta}(\mathbf{x}) \left|\nabla \mathbf{D}^{\beta} \mathbf{u}(\mathbf{x})\right|) =$$

$$= \sum_{\left|\beta\right| = \mathbf{m}_{j} - 1}^{n} \{(\mathbf{c}^{j, \beta}(\mathbf{x}) \left|\nabla \mathbf{D}^{\beta} \mathbf{u}(\mathbf{x})\right|) \frac{\partial \mathbf{D}^{\beta} \mathbf{u}(\mathbf{x})}{\partial \nu(\mathbf{x})} + (\operatorname{Re} \operatorname{Te}^{j, \beta}(\mathbf{x}) \left|\nabla \mathbf{D}^{\beta} \mathbf{u}(\mathbf{x})\right|) + i (\operatorname{Im} \operatorname{Te}^{j, \beta}(\mathbf{x}) \left|\nabla \mathbf{D}^{\beta} \mathbf{u}(\mathbf{x})\right|)\},$$

We now introduce the integral curves associated to the (real) vector fields Vd,  $Re Tc^{j,\beta}$ ,  $Im Tc^{j,\beta}$ , namely

(2.10) 
$$\begin{cases} \frac{d}{d\sigma} \mu(\sigma, \mathbf{x}) = \nabla d(\mu(\sigma, \mathbf{x})), \ \sigma > 0 \\ \\ \mu(0, \mathbf{x}) = \mathbf{x} \in \partial \Omega, \end{cases}$$
(2.11) 
$$\begin{cases} \frac{d}{d\sigma} \lambda^{\mathbf{j}, \beta}(\sigma, \mathbf{x}) = \operatorname{Re} \operatorname{Tc}^{\mathbf{j}, \beta}(\lambda^{\mathbf{j}, \beta}(\sigma, \mathbf{x})) \ \sigma > 0, \\ \\ \lambda^{\mathbf{j}, \beta}(0, \mathbf{x}) = \mathbf{x} \in \partial \Omega, \end{cases}$$
(2.12) 
$$\begin{cases} \frac{d}{d\sigma} \eta^{\mathbf{j}, \beta}(\sigma, \mathbf{x}) = \operatorname{Im} \operatorname{Tc}^{\mathbf{j}, \beta}(\eta^{\mathbf{j}, \beta}(\sigma, \mathbf{x})), \ \sigma > 0 \\ \\ \eta^{\mathbf{j}, \beta}(0, \mathbf{x}) = \mathbf{x} \in \partial \Omega. \end{cases}$$

$$= -\frac{1}{\sigma} \left[ \frac{\partial f}{\partial v(X)} (X - \sigma X) - \frac{\partial f}{\partial v(X)} (X) \right] ,$$

and finally

$$\mathsf{D}_{\mathtt{A}}(\frac{1}{4},\infty) = \{ \, \mathtt{f} \in \Lambda^{1}(\widetilde{\Omega}) : \mathtt{f} = 0 \, \text{ on } \, \Im \Omega \} \,, \quad \mathsf{D}_{\mathtt{A}}(\frac{1}{4}) = \lambda^{1}(\widetilde{\Omega}) \, \mathsf{D}_{\mathtt{A}}(\frac{1}{4},\infty) \,;$$

$$D_{\mathbf{A}}(\frac{1}{2}, \omega) = \{ \mathbf{f} \in \Lambda^{2}(\Omega) : \mathbf{f} = 0 \text{ on } \partial\Omega, \}$$

$$\sup_{\sigma \in \left] 0, \sigma_{0}^{-1} \right] = \sup_{X \in \left[ \partial \Omega \right]} \frac{1}{\sigma} \left| \frac{\partial f}{\partial \nu(X)} \right|_{\left( X - \sigma \nu(X) \right)} = \frac{\partial f}{\partial \nu(X)} \left( X \right) \left| < \infty \right|_{\left( X - \sigma \nu(X) \right)}$$

$$D_{\underline{A}}(\frac{1}{2}) = \{ f \in \Lambda^{2}(\overline{\Omega}) : f = 0 \text{ on } \partial\Omega, \lim_{\sigma \downarrow 0} \frac{1}{\sigma} \left[ \frac{\partial f}{\partial \nu(X)} (X - \sigma \nu(X)) - \frac{\partial f}{\partial \nu(X)} (X) \right]$$

$$= b_{1}(x) f_{x}(x) + b_{2}(x) f_{y}(x) + b_{0}(x) f(x) \quad \forall x \in \partial \Omega \},$$

$$\mathbf{D}_{\mathbf{A}}(\frac{3}{4},\infty) = \{\mathbf{f} \in \Lambda^3(\overline{\Omega}) : \mathbf{f} = 0 \text{ and } \mathbf{B}_2(\mathbf{X},\mathbf{D}) \cdot \mathbf{f} = 0 \text{ on } \partial\Omega\}, \\ \mathbf{D}_{\mathbf{A}}(\frac{3}{4}) = \lambda^3(\overline{\Omega}) \cap \mathbf{D}_{\mathbf{A}}(\frac{3}{4},\infty) \ .$$

REMARK 2.6. In (2.13) we may replace the ratio  $\frac{D^{\beta}f(\mu(\sigma,x))-D^{\beta}f(x)}{\sigma}$  by the simpler one

$$\frac{D^{\beta}f(x-\sigma v(x))-D^{\beta}f(x)}{\sigma},$$

indeed for  $f \in \Lambda^{\mathbf{q}}(\Omega)$  the difference between such terms is o(1) as  $\sigma + O(1)$  (see Remark 5.3 below).

## 3. THE FIRST INCLUSION

Let A be defined by (1.8) and suppose that (1.9) holds. We want to prove the following

THEOREM 3.1. If  $\theta \in ]0,1[$  and  $q:=2m\theta \in \mathbb{N}$ , then

$$\Lambda_{B}^{q}(\overline{\Omega}) \hookrightarrow D_{A}^{(\theta,\infty)}$$

 $\underline{\text{Proo}(\underline{t})}$ . According to (1.10) it is enough to show that

$$= \sum_{\beta = m_{j}-1}^{n} \sum_{i=1}^{n} [N(\beta + e^{i})]^{-1} b_{j,\beta+e^{i}}(x) b^{\beta} b_{i}u(x)$$

Set now for  $|\beta| = n-1$  and i=1,...,n

$$(2.8) \quad c^{j,\beta}(x) := \{c_{i}^{j,\beta}(x)\}_{1 \le i \le n} ; c_{i}^{j,\beta}(x) := [N(\beta + e^{i})]^{-1} b_{j,\beta + e^{i}}(x),$$

$$Tc^{j,\beta}(x) := c^{j,\beta}(x) - (c^{j,\beta}(x)|v(x))v(x).$$

Then we can rewrite  $\frac{B}{B}(x,D)u$  as:

$$(2.9) \quad \overline{B}_{j}(x,D)u = \sum_{\left|\beta\right| = m_{j}-1}^{n} c_{i}^{j,\beta}(x)D^{\beta}D_{i}u(x) =$$

$$= \sum_{\left|\beta\right| = m_{j}-1}^{n} (c^{j,\beta}(x))\nabla D^{\beta}u(x)) =$$

$$= \sum_{\left|\beta\right| = m_{j}-1}^{n} \{(c^{j,\beta}(x))\nabla D^{\beta}u(x)) \frac{\partial D^{\beta}u(x)}{\partial \nu(x)}$$

$$+ (\operatorname{Re} \operatorname{Te}^{j,\beta}(x))\nabla D^{\beta}u(x)) + i(\operatorname{Im} \operatorname{Te}^{j,\beta}(x))\nabla D^{\beta}u(x)).$$

We now introduce the integral curves associated to the (real) vector fields  $\forall d$ , Re  $\operatorname{Tc}^{j,\beta}$ , Im  $\operatorname{Tc}^{j,\beta}$ , namely

(2.10) 
$$\begin{cases} \frac{d}{d\sigma} \mu(\sigma, \mathbf{x}) = \nabla d(\mu(\sigma, \mathbf{x})), \ \sigma > 0 \\ \\ \mu(0, \mathbf{x}) = \mathbf{x} \in \partial\Omega \end{cases}$$

(2.11) 
$$\begin{cases} \frac{d}{d\sigma} \lambda^{j,\beta}(\sigma,x) = \operatorname{Re} \operatorname{Tc}^{j,\beta}(\lambda^{j,\beta}(\sigma,x)) & \sigma > 0, \\ \\ \lambda^{j,\beta}(0,x) = x \in \partial\Omega, \end{cases}$$

(2.12) 
$$\begin{cases} \frac{d}{d\sigma} \eta^{j,\beta}(\sigma,x) = \text{Im } \text{Te}^{j,\beta}(\eta^{j,\beta}(\sigma,x)), \sigma>0 \\ \eta^{j,\beta}(0,x) = x \in \partial\Omega. \end{cases}$$

$$= -\frac{1}{\sigma} \left[ \frac{\partial f}{\partial \nu(x)} (x - \sigma x) - \frac{\partial f}{\partial \nu(x)} (x) \right] ,$$

and finally

$$\mathbf{D}_{\mathbf{A}}(\frac{1}{4},\infty) = \{\mathbf{f} \in \Lambda^{1}(\widetilde{\Omega}) : \mathbf{f} = 0 \text{ on } \partial\Omega\}, \quad \mathbf{D}_{\mathbf{A}}(\frac{1}{4}) = \lambda^{\widehat{1}}(\widetilde{\Omega}) \cap \mathbf{D}_{\mathbf{A}}(\frac{1}{4},\infty) ;$$

$$D_{\mathbf{A}}(\frac{1}{2},\infty) = \{\mathbf{f} \in \Lambda^{2}(\Omega) : \mathbf{f} = 0 \text{ on } \partial\Omega,$$

$$\sup_{\sigma \in \left] 0, \sigma_{0} \right]} \sup_{x \in \partial \Omega} \frac{1}{\sigma} \left| \frac{\partial f}{\partial \nu(x)} \left( x - \sigma \nu(x) \right) \right| = \frac{\partial f}{\partial \nu(x)} \left( x \right) \left| < \infty \right|,$$

$$\mathbb{D}_{A}(\frac{1}{2}) = \{ f \in \Lambda^{2}(\overline{\Omega}) : f = 0 \text{ on } \partial\Omega, \lim_{\sigma \downarrow 0} \frac{1}{\sigma} \left[ \frac{\partial f}{\partial \nu(X)} \right] (X - \sigma \nu(X)) - \frac{\partial f}{\partial \nu(X)} (X) \}$$

$$= b_{1}(x) f_{x}(x) + b_{2}(x) f_{y}(x) + b_{0}(x) f(x) \qquad \forall x \in \partial \Omega \},$$

$$\mathsf{D}_{\mathtt{A}}(\frac{3}{4},\infty) = \{ \mathtt{f} \in \Lambda^3(\overline{\Omega}) : \mathtt{f} = \mathtt{0} \text{ and } \mathsf{B}_{\mathtt{2}}(\mathtt{X},\mathtt{D}) \, \mathtt{f} = \mathtt{0} \text{ on } \Im \} \, , \\ \mathsf{D}_{\mathtt{A}}(\frac{3}{4}) = \lambda^3(\overline{\Omega}) \cap \mathsf{D}_{\mathtt{A}}(\frac{3}{4},\infty) \, .$$

REMARK 2.6. In (2.13) we may replace the ratio  $\frac{D^{\beta}f(\mu(\sigma,x))-D^{\beta}f(x)}{\sigma}$  by the simpler one

$$\frac{D^{\beta}f(x-\sigma v(x))-D^{\beta}f(x)}{\sigma} ,$$

indeed for  $f \in \Lambda^{\mathbf{q}}(\Omega)$  the difference between such terms is o(1) as  $\sigma \downarrow 0$ (see Remark 5.3 below).

## 3. THE FIRST INCLUSION

Let A be defined by (1.8) and suppose that (1.9) holds. We want to prove the following

THEOREM 3.1. If  $\theta \in ]0,1[$  and  $q := 2m\theta \in IN$ , then

$$\Lambda_{B}^{q}(\overline{\Omega}) \hookrightarrow D_{A}^{(\theta,\infty)}$$

Prooff. According to (1.10) it is enough to show that

As in [Acquistapace-Terreni, 1987], this will be done by constructing, for each fixed  $f \in \Lambda_{\mathbb{R}}^{q}(\overline{\Omega})$ , a function  $w : [1,\infty[ \to C(\overline{\Omega})]]$  such that

(3.3) 
$$\|\operatorname{AR}(s, \lambda) \operatorname{w}(s)\| \leq c \operatorname{g}^{-\theta} \operatorname{f} \|\operatorname{f}\| \qquad \forall s \geq 1.$$

Obviously (3.2) and (3.3) imply (3.1).

Let  $f \in \Lambda_{R}^{q}(\Omega)$  and consider an extension  $F \in \Lambda_{\Omega}^{q'}(\dot{\mathbb{R}}^{n})$ , which exists by Proposition 2.1. Fix a real-valued function  $\phi \in C_0^\infty(\mathbb{R}^n)$  such that  $0 \le \phi \le 1$ ,  $\phi \equiv 0$  outside B(0,1),  $\int \phi(z) dz = 1$  and  $\phi$  is even in each variable, and set

$$\phi_{\mathbf{t}}(\mathbf{z}) := \mathbf{t}^{-n} \phi(\frac{\mathbf{z}}{\mathbf{t}})$$
 ,  $\mathbf{z} \in \mathbb{R}^{n}$  ,  $\mathbf{t} \in ]0,1]$ .

Define finally (compare with (2.4)):

$$v(t,x) := \int_{\mathbb{R}^{n}} \left[ (-1)^{q} (\Delta_{z}^{q+1} F)(x) + F(x) \right] \phi_{t}(z) dz , x \in \mathbb{R}^{n} , t \in ]0,1];$$

then clearly

$$v(t,x) - F(x) = \int_{\mathbb{R}^n} \int_{h=0}^{q+1} (-1)^{h+1} {q+1 \choose h} F(x+hz) \phi_t(z) dz.$$

Hence if  $\beta \leq q-1$  we have by (2.3) (since  $D^{\beta} \in \Lambda^{q-|\beta|}(\mathbb{R}^n)$ ):

$$(3.5) \quad \left| D^{\beta} v(t,x) - D^{\beta} F(x) \right| = \left| \int_{\mathbb{R}^{n}} (-1)^{q} (\Lambda_{z}^{q+1} D^{\beta} F)(x) \phi_{t}(z) dz \right| \leq$$

$$\leq C_{q} \left[ F \right]_{\Lambda^{q}(\mathbb{R}^{n})} \int_{\mathbb{R}^{n}} \left| z \right|^{q-\left|\beta\right|} \phi_{t}(z) dz \leq$$

$$\leq C_{q} \left[ f \right]_{\Lambda^{q}(\Omega)} t^{q-\left|\beta\right|}.$$

Next, if  $|\alpha|=q-1$  and  $|\gamma|$  is even and larger than 1, we get:

 $\left| D^{\alpha+\gamma} \mathbf{v}(\mathbf{t}, \mathbf{x}) \right| = \left| D^{\gamma} \int_{\mathbf{D}} \left( -1 \right)^{\mathbf{q}} \left\{ \Delta_{\mathbf{z}}^{\mathbf{q}+1} D^{\alpha} \mathbf{F} \right) \left( \mathbf{x} \right) \phi_{\mathbf{t}}(\mathbf{z}) d\mathbf{z} \right| \leq$  $\leq \sum_{h=1}^{d+1} {q+1 \choose h} \left| \int_{\mathbb{R}^n} D^{\alpha} F(y) D^{\gamma} \phi_{\xi} \left( \frac{y-x}{h} \right) dy \right| h^{-|\gamma|} =$  $= \sum_{h=1}^{q+1} {\binom{q+1}{h}} \frac{h^{-|\gamma|}}{2} \left| \int_{\mathbb{T}^n} n \left[ D^{\alpha} F(x+hz) + D^{\alpha} F(x-hz) \right] \right|$  $-2D_{\mathsf{F}}^{\mathsf{q}}(x)] D^{\mathsf{q}}_{\mathsf{t}}(z)dz \Big] \leq c_{\mathsf{q}} [\mathsf{F}]_{\mathsf{A}^{\mathsf{q}}(\mathsf{TR}^{\mathsf{n}})} \mathsf{t}^{1-\left|\gamma\right|} \leq$  $\leq c_{\mathbf{q}} \left[ f \right]_{\Lambda^{\mathbf{q}}(\Omega)} t^{\mathbf{q} - \left[ \alpha + \gamma \right]};$ 

thus if  $|\beta| > q$  and  $|\beta| - q$  is even we obtain

$$|D^{\beta}v(t,x)| \leq c_{q} \left[f\right]^{q-|\beta|} t^{q-|\beta|}.$$

On the other hand if  $|\beta| > q$  and  $|\beta| - q$  is odd, by interpolation (3.6)

$$(3.7) \quad \|D^{\beta}v(t,\cdot)\|_{C(\mathbb{R}^{n})} \leq c\|v^{|\beta|+1}v(t,\cdot)\|^{1/2} \quad \|v^{|\beta|-1}v(t,\cdot)\|^{1/2} \leq c(\mathbb{R}^{n})$$

$$\leq c_{q} \left[f\right]_{\Lambda^{q}(\Omega)} t^{q-|\beta|}.$$

By (3.6) and (3.7) we conclude that

$$(3.8) \quad \|\nabla^{|\beta|} \mathbf{v}(t,\cdot)\| \leq \mathbf{c}_{\mathbf{q}} [f] \quad t^{\mathbf{q} \cdot |\beta|}.$$

Finally if  $|\beta|=q$  we do not have the boundedness of  $\|\nabla^{\mathbf{q}}\mathbf{v}(t, {\mbox{\bf \cdot}})\|$ but the weaker estimate (due to the fact that  $F \in C^{q-\epsilon}(\mathbb{R}^n)$   $\forall \epsilon \in ]0,q[$ )

$$(3.9) \qquad \|\nabla^{\mathbf{q}} \mathbf{v}(\mathbf{t}, \cdot)\|_{L} \leq c \qquad \leq \left[f\right] \qquad t^{-\varepsilon} \quad \forall \varepsilon \in ]0, q[.]$$

Hence if we set

$$w(s)(x) = w(s,x) := v(s^{-1/2m},x), x \in \overline{\Omega}, s \ge 1$$

we easily obtain:

13

PROPOSITION 3.2. We have  $w \in C^{\infty}([1,\infty] \times \Omega)$  and:

$$\text{(i)} \quad \| \nabla^k \mathbf{w}(\mathbf{s}) - \nabla^k \mathbf{f} \|_{C(\widetilde{\Omega})} \leq c_q [\mathbf{f}]_{\Lambda^q(\widetilde{\Omega})} \mathbf{s}^{-(q-k)/2m} \quad \text{if} \quad k < q,$$

(ii) 
$$\|\nabla^{\mathbf{q}}_{\mathbf{w}}(s)\|_{C(\overline{\Omega})} \leq c_{\mathbf{q}, \epsilon} [f]_{C^{2m(\theta-\epsilon)}(\overline{\Omega})} s^{\epsilon} \quad \forall \epsilon \in ]0, \mathbf{q}/2m[$$

$$(\text{lii}) \quad \| \overline{v}^k_{\text{W}}(s) \|_{C(\overline{\Omega})} \leq c_q \, [\, f \, ] \, s^{(k-q)/2m} \quad \text{if} \quad k > q. \quad \blacksquare$$

In particular, part (i) implies (3.2). Let us prove (3.3). Set u(s) := s R(s,A)w(s), s>1, so that

(3.10) 
$$AR(s,A)w(s)=u(s)-w(s)$$
,  $s>1$ .

Looking at the elliptic problem solved by u(s)-w(s), and applying the spectral estimate in C  $(\Omega)$  (see in particular [Acquistapace-Terreni, 1987, (3.13)] we have:

Clearly by Proposition 3.2

(3.12) 
$$J_{1} \leq c s^{-1} \sum_{\beta | \leq 2m} \|D^{\beta}_{w}(s)\|_{C(\overline{\Omega})} \leq c s^{-1} \{1 + s^{(2m-q)/2m}\} [f]_{\Lambda^{q}(\overline{\Omega})} \leq$$

$$\leq c s^{-q/2m} [f]_{\Lambda^{q}(\overline{\Omega})} .$$

In order to estimate  $J_2$ , we split it as follows:

(3.13) 
$$J_2 = c \sum_{j=1}^{m} \left\{ \sum_{k=0}^{q-1-m_j} + \sum_{k=q-m_j}^{2m-m_j} \right\} \|B_j(\cdot,D)w(s)\| \cdot k = q+1-m_j$$

$$s^{-(m_j+k)/2m} =: I_1 + I_2 + I_3$$

where some of the sums  $\;$  may be empty (e.g. I  $_2$  has no addenda when  $\;$  m  $_j\!>\!q). Again Proposition 3.2 yields$ 

$$(3.14) \quad I_{1} = c \sum_{j=1}^{m} \sum_{k=0}^{q-1-m_{j}} \|B_{j}(\cdot, D)(w(s)-f)\|_{C} c (3.25)$$

$$\cdot s^{-(m_{j}+k)/2m} \leq c_{q}[f] s^{-q/2m},$$

$$(3.25) \quad I_{3} \leq c \sum_{j=1}^{m} \sum_{k=q+1-m_{j}}^{2m-m_{j}} \sum_{h=0}^{k+m_{j}} \|\nabla^{h}_{w}(s)\|_{C(\overline{\Omega})} s^{-(m_{j}+k)/2m}$$

$$\leq c_{q}[f] c_{q}[1+s^{-(q-k-m_{j})/2m}] s^{-(m_{j}+k)/2m} \leq c_{q}[f] c_{q}[1+s^{-(q-k-m_{j})/2m}] s^{-(m_{j}+k)/2m}$$

concerning  $I_2$  , we will show that

$$(3.16) \qquad \|\mathbf{B}_{\mathbf{j}}(\cdot,\mathbf{D})\mathbf{w}(\mathbf{s})\| \leq c^{\mathbf{q}-\mathbf{m}\mathbf{j}}(\partial\Omega) \leq c^{\mathbf{q}} \Lambda^{\mathbf{q}}(\overline{\Omega}) \Lambda^{\mathbf{q}}_{\mathbf{B}}(\overline{\Omega}) \qquad \mathbf{vs}\geq 1, \forall \mathbf{j}=1,\dots,m:$$

this will imply, by (3.13), (3.14) and (3.15), that

$$J_{2} \leq c_{q}^{\{[f]} \bigwedge_{\Lambda^{q}(\overline{\Omega})} + [f]_{\Lambda^{q}_{R}(\overline{\Omega})} + s^{-q/2m}$$

and, recalling (3.12), (3.10) and (3.11), the proof of (3.3) will be complete.

Let us prove (3.16) (note that this term appears only when m  $_j \leq q)$  . If m  $_j < q$  , by Propositions 2.3 and 3.2 we get:

and it remains to consider the case m = q, i.e. to estimate the quantity

 $B_{j}^{(x,D)w(s,x)=B}(x,D)w(s,x)+\overset{\circ}{B}(x,D)w(s,x) \ , \ x{\in}\,\vartheta\Omega \ , \ s\,\geq\,1\,,$ 

where we have denoted by  $\overset{-}{B}$  the principal part of  $\overset{-}{B}$  and by  $\overset{\circ}{B}$  its lower order part. Obviously

$$(3.18) \qquad \left| \stackrel{\circ}{\mathbb{B}}_{j}(x,D)w(s,x) \right| \leq c \|w(s)\|_{C^{m_{j}-1}(\overline{\Omega})} \leq c \left[ f \right]_{\Lambda^{q}(\overline{\Omega})};$$

on the other hand, recalling (2.13) we can write:

$$|\overline{B}_{j}(x,D)w(s,x)| \leq |\overline{B}_{j}(x,D)w(s,x) - [\Delta_{\sigma}^{B_{j}}w(s,\cdot)](x)| + |[\Delta_{\sigma}^{B_{j}}(w(s,\cdot)-f)](x)| + |(\Delta_{\sigma}^{B_{j}}f)(x)| = |T_{1} + T_{2} + T_{3}|,$$

where  $\sigma \in ]0,\sigma_0^{}]$  . Now, taking into account (2.9) and (2.13) it can be checked that

whereas, by assumption, T does not exceed [f] . Hence, choosing  $\alpha := \sigma_0^{-*s} ^{-1/2m}, \text{ we deduce}$ 

$$(3.20) \quad \left[\overline{B}_{j}(x,D)w(s,x)\right] \leq c_{q}\{[f]_{A_{\overline{B}}^{q}(\overline{\Omega})}\} \quad \forall s \geq 1, \quad \forall x \in \mathfrak{d}\Omega, \quad \forall j=1,\ldots,m.$$

By (3.17), (3.18) and (3.20) we finally obtain (3.16). The proof is complete.

9.4

4. THE SECOND INCLUSION.

Let A be defined again by (1.8) and assume (1.9). We want to prove:

THEOREM 4.1. If  $\theta \in ]0,1[$  and  $q:=2m\theta \in I\!N$ , then

$$D_{A}(\theta,\infty) \subseteq \Lambda_{B}^{q}(\overline{\Omega})$$
.

<u>Proof.</u> Let  $f \in D_A^{(\theta,\infty)}$ . By the Reiteration Theorem [Triebel, 1978, Theorem 1.10.2] and by [Acquistapace-Terreni, 987, Theorem 2.3] we have (with equivalence of norms)

$$\mathbf{D}_{\mathbf{A}}(\theta, \infty) = (\mathbf{D}_{\mathbf{A}}(\frac{\mathbf{q} + \varepsilon}{2\mathbf{m}}, \infty) \ , \ \mathbf{D}_{\mathbf{A}}(\frac{\mathbf{q} - \varepsilon}{2\mathbf{m}}, \infty)) = (\mathbf{C}_{\mathbf{B}}^{\mathbf{q} + \varepsilon}(\overline{\Omega}), \mathbf{C}_{\mathbf{B}}^{\mathbf{q} - \varepsilon}(\overline{\Omega})) = (\mathbf{C}_{\mathbf{B}}^{\mathbf{q} + \varepsilon}(\overline{\Omega}), \mathbf{C}_{\mathbf{B}}^{\mathbf{q} - \varepsilon}(\overline{\Omega}))$$

where  $\epsilon \in ]0,1[$ . Then, by definition [Lions-Peetre, 1964], there exists a function  $u:]0,1] \to c_B^{q+\epsilon}(\overline{\Omega})$  such that:

$$\begin{cases} \sup_{t \in [0,1]} t^{1/2} \|u(t)\|_{C^{q+\epsilon}} + \sup_{t \in [0,1]} t^{1/2} \|u'(t)\|_{C^{q-\epsilon}} \leq \kappa_{q}^{-\epsilon} \|f\|_{D_{A}(\theta,\infty)} \\ \lim_{t \in [0,1]} c^{q+\epsilon} \|g\|_{D_{A}(\theta,\infty)} \end{cases}$$

$$\begin{cases} \sup_{t \in [0,1]} t^{1/2} \|u'(t)\|_{C^{q+\epsilon}} \leq \kappa_{q}^{-\epsilon} \|f\|_{D_{A}(\theta,\infty)} \\ \lim_{t \in [0,1]} t^{1/2} \|u'(t)\|_{C^{q+\epsilon}} \leq \kappa_{q}^{-\epsilon} \|f\|_{D_{A}(\theta,\infty)} \end{cases}$$

$$\begin{cases} \sup_{t \in [0,1]} t^{1/2} \|u(t)\|_{C^{q+\epsilon}} \leq \kappa_{q}^{-\epsilon} \|f\|_{D_{A}(\theta,\infty)} \end{cases}$$

$$\begin{cases} \sup_{t \in [0,1]} t^{1/2} \|u(t)\|_{C^{q+\epsilon}} \leq \kappa_{q}^{-\epsilon} \|f\|_{D_{A}(\theta,\infty)} \end{cases}$$

$$\begin{cases} \sup_{t \in [0,1]} t^{1/2} \|u(t)\|_{C^{q+\epsilon}} \leq \kappa_{q}^{-\epsilon} \|f\|_{D_{A}(\theta,\infty)} \end{cases}$$

$$\begin{cases} \sup_{t \in [0,1]} t^{1/2} \|u(t)\|_{C^{q+\epsilon}} \leq \kappa_{q}^{-\epsilon} \|f\|_{D_{A}(\theta,\infty)} \end{cases}$$

$$\begin{cases} \sup_{t \in [0,1]} t^{1/2} \|u(t)\|_{C^{q+\epsilon}} \leq \kappa_{q}^{-\epsilon} \|f\|_{D_{A}(\theta,\infty)} \end{cases}$$

$$\begin{cases} \sup_{t \in [0,1]} t^{1/2} \|u(t)\|_{C^{q+\epsilon}} \leq \kappa_{q}^{-\epsilon} \|f\|_{D_{A}(\theta,\infty)} \end{cases}$$

$$\begin{cases} \sup_{t \in [0,1]} t^{1/2} \|u(t)\|_{C^{q+\epsilon}} \leq \kappa_{q}^{-\epsilon} \|f\|_{D_{A}(\theta,\infty)} \end{cases}$$

$$\begin{cases} \sup_{t \in [0,1]} t^{1/2} \|u(t)\|_{C^{q+\epsilon}} \leq \kappa_{q}^{-\epsilon} \|f\|_{D_{A}(\theta,\infty)} \end{cases}$$

$$\begin{cases} \sup_{t \in [0,1]} t^{1/2} \|u(t)\|_{C^{q+\epsilon}} \leq \kappa_{q}^{-\epsilon} \|f\|_{D_{A}(\theta,\infty)} \end{cases}$$

$$\begin{cases} \sup_{t \in [0,1]} t^{1/2} \|u(t)\|_{C^{q+\epsilon}} \leq \kappa_{q}^{-\epsilon} \|f\|_{D_{A}(\theta,\infty)} \end{cases}$$

$$\begin{cases} \sup_{t \in [0,1]} t^{1/2} \|u(t)\|_{C^{q+\epsilon}} \leq \kappa_{q}^{-\epsilon} \|f\|_{D_{A}(\theta,\infty)} \end{cases}$$

Thus, in particular,  $f \in (C^{q+\epsilon}(\overline{\Omega}), C^{q-\epsilon}(\overline{\Omega}))_{\frac{1}{2}, \infty}$ , i.e., by Proposition 2.1,  $f \in \Lambda^{q}(\overline{\Omega})$ ; in addition  $B_{j}(\cdot, D) f = 0$  on  $2 \in \mathbb{R}^{q}$  if  $m_{j} < q$ , since  $u(t) \to f$  in  $C^{q-\epsilon}(\overline{\Omega})$  as  $t \neq 0$ .

We have to show that [f] is finite. The following lemma is  $\Lambda_B^{\mathbf{q}}(\overline{\Omega})$ 

crucial for this purpose:

LEMMA 4.2. Fix  $|\gamma| = q-1$ . We have:

$$\begin{split} \text{(i)} \quad & \left| \mathbf{D}^{\gamma}_{\mathbf{f}}(\mathbf{x}) - \mathbf{D}^{\gamma}_{\mathbf{f}}(\mathbf{y}) - \mathbf{D}^{\gamma}_{\mathbf{u}}(\mathbf{t}, \mathbf{x}) + \mathbf{D}^{\gamma}_{\mathbf{u}}(\mathbf{t}, \mathbf{y}) \right| \leq \\ & \leq \mathbf{c}_{\mathbf{q}} \left[ \mathbf{f} \right]_{D_{\mathbf{A}}(\theta, \infty)} \mathbf{t}^{1/2} \left| \mathbf{x} - \mathbf{y} \right|^{1 - \varepsilon} \quad \forall \mathbf{t} \in ]0, 1], \ \forall \mathbf{x}, \mathbf{y} \in \overline{\Omega}, \end{split}$$

7

(ii) If 
$$v \in \text{Lip}(\overline{\Omega}, \mathbb{R}^n)$$
 and  $\beta : [0, \sigma_0] \to \overline{\Omega}$  solves 
$$\begin{cases} \beta'(\sigma) = v(\beta(\sigma)) \ , \ \sigma \in [0, \sigma_0] \\ \beta(0) = x \in \overline{\Omega} \end{cases}$$

ther

$$\left| \frac{\mathsf{D}^{\gamma} \mathsf{u}\left(\mathsf{t},\beta\left(\sigma\right)\right) - \mathsf{D}^{\gamma} \mathsf{u}\left(\mathsf{t},x\right)}{\sigma} - \left( \forall \mathsf{D}^{\gamma} \mathsf{u}\left(\mathsf{t},x\right) \middle| \mathsf{v}\left(x\right) \right) \right| \leq c_{\mathbf{q}} \left[ \mathsf{f} \right]_{D_{\widehat{\mathbf{A}}}\left(\theta,\infty\right)} \mathsf{t}^{-1/2} \sigma^{\epsilon}$$
 
$$\forall \mathsf{t} \in \left] \left[ 0,1 \right] \; , \; \forall \mathsf{v} \in \left] \left[ 0,\sigma_{\widehat{\mathbf{A}}} \right] \; .$$

Proof. (i) We have

$$\begin{split} \left| D^{\gamma} f(x) - D^{\gamma} f(y) - D^{\gamma} u(t,x) + D^{\gamma} u(t,y) \right| &= \left| \int\limits_{0}^{t} \left[ D^{\gamma} u_{s}(s,x) - D^{\gamma} u_{s}(s,y) \right] ds \right| &\leq \\ &\leq \int\limits_{0}^{t} \left[ u'(s) \right]_{C^{q-\epsilon}(\overline{\Omega})} ds \left| x - y \right|^{1-\epsilon} &\leq K_{1} \left[ f \right]_{D_{\underline{A}}(\theta,\infty)} t^{1/2} \left| x - y \right|^{1-\epsilon}. \end{split}$$

(ii) We have:

$$\begin{split} &\left|\frac{D^{\gamma}u(t,\beta(\sigma))-D^{\gamma}u(t,x)}{\sigma}-(\nabla D^{\gamma}u(t,x)\left|v(x)\right|\right|=\\ &=\left|\frac{1}{\sigma}\int\limits_{0}^{\sigma}\frac{d}{d\rho}D^{\gamma}u(t,\beta(\rho))d\rho-(\nabla D^{\gamma}u(t,x)\left|v(x)\right|\right|=\\ &=\left|\frac{1}{\sigma}\int\limits_{0}^{\sigma}\left[(\nabla D^{\gamma}u(t,\beta(\rho))\left|v(\beta(\rho))-(\nabla D^{\gamma}u(t,x)\left|v(x)\right|\right]d\rho\right|\leq\\ &\leq\frac{1}{\sigma}\int\limits_{0}^{\sigma}\left[\left[u(t)\right]_{C}\frac{1}{Q^{1+\epsilon}}\frac{1}{(\Omega)}\frac{1+\epsilon}{C(\Omega)}\frac{\rho^{\epsilon}+\|\nabla^{Q}u(t)\|}{C(\Omega)}\frac{1}{C(\Omega)}\frac{\|v\|}{C(\Omega)}\frac{\rho}{C(\Omega)}\right]\\ &\leq cK_{Q}\left[f\right]_{D_{A}(\theta,\infty)}t^{-1/2}\sigma^{\epsilon}. \end{split}$$

Let us show that [f] is finite. Indeed, let m =q and fix x  $\in \partial \Omega$ ;  $\Lambda_B^q(\overline{\Omega})$ 

by Lemma 4.2, recalling that  $B_{ij}(x,D)u(t,x)=0$ , we get:

$$\left| \left( \Delta_{\sigma}^{Bj} f \right) (x) \right| \leq \left| \left( \Delta_{\sigma}^{Bj} \left[ f - u(t, \cdot) \right] \right) (x) \right| + \left| \left[ \Delta_{\sigma}^{Bj} u(t, \cdot) \right] (x) - B_{j}^{Bj} (x, D) u(t, x) \right| + \left| \left[ \Delta_{\sigma}^{Bj} u(t, \cdot) \right] (x) - B_{j}^{Bj} (x, D) u(t, x) \right| + \left| \left[ \Delta_{\sigma}^{Bj} u(t, \cdot) \right] (x) - B_{j}^{Bj} (x, D) u(t, x) \right| + \left| \left[ \Delta_{\sigma}^{Bj} u(t, \cdot) \right] (x) - B_{j}^{Bj} (x, D) u(t, x) \right| + \left| \left[ \Delta_{\sigma}^{Bj} u(t, \cdot) \right] (x) - B_{j}^{Bj} (x, D) u(t, x) \right| + \left| \left[ \Delta_{\sigma}^{Bj} u(t, \cdot) \right] (x) - B_{j}^{Bj} (x, D) u(t, x) \right| + \left| \left[ \Delta_{\sigma}^{Bj} u(t, \cdot) \right] (x) - B_{j}^{Bj} (x, D) u(t, x) \right| + \left| \left[ \Delta_{\sigma}^{Bj} u(t, \cdot) \right] (x) - B_{j}^{Bj} (x, D) u(t, x) \right| + \left| \left[ \Delta_{\sigma}^{Bj} u(t, \cdot) \right] (x) - B_{j}^{Bj} (x, D) u(t, x) \right| + \left| \left[ \Delta_{\sigma}^{Bj} u(t, \cdot) \right] (x) - B_{j}^{Bj} (x, D) u(t, x) \right| + \left| \left[ \Delta_{\sigma}^{Bj} u(t, \cdot) \right] (x) - B_{j}^{Bj} (x, D) u(t, x) \right| + \left| \left[ \Delta_{\sigma}^{Bj} u(t, \cdot) \right] (x) - B_{j}^{Bj} (x, D) u(t, x) \right| + \left| \left[ \Delta_{\sigma}^{Bj} u(t, \cdot) \right] (x) - B_{j}^{Bj} (x, D) u(t, x) \right| + \left| \left[ \Delta_{\sigma}^{Bj} u(t, \cdot) \right] (x) - B_{j}^{Bj} (x, D) u(t, x) \right| + \left| \left[ \Delta_{\sigma}^{Bj} u(t, \cdot) \right] (x) - B_{j}^{Bj} (x, D) u(t, x) \right| + \left| \left[ \Delta_{\sigma}^{Bj} u(t, \cdot) \right] (x) - B_{j}^{Bj} (x, D) u(t, x) \right| + \left| \left[ \Delta_{\sigma}^{Bj} u(t, \cdot) \right] (x) - B_{j}^{Bj} (x, D) u(t, x) \right| + \left| \left[ \Delta_{\sigma}^{Bj} u(t, \cdot) \right] (x) - B_{j}^{Bj} (x, D) u(t, x) \right| + \left| \left[ \Delta_{\sigma}^{Bj} u(t, \cdot) \right] (x) - B_{j}^{Bj} (x, D) u(t, x) \right| + \left| \left[ \Delta_{\sigma}^{Bj} u(t, \cdot) \right] (x) - B_{j}^{Bj} (x, D) u(t, x) \right| + \left| \left[ \Delta_{\sigma}^{Bj} u(t, \cdot) \right] (x) - B_{j}^{Bj} (x) + \left| \left[ \Delta_{\sigma}^{Bj} u(t, \cdot) \right] (x) - B_{j}^{Bj} (x) + \left| \left[ \Delta_{\sigma}^{Bj} u(t, \cdot) \right] (x) - B_{j}^{Bj} (x) + \left| \left[ \Delta_{\sigma}^{Bj} u(t, \cdot) \right] (x) - B_{j}^{Bj} (x) + B_{$$

Now by Lemma 4.2(i)

$$\begin{split} & s_1 \leq c_q \sigma^{-1} \left[ f \right]_{D_A(\theta, \infty)} t^{1/2} \sum_{\left| \gamma \right| = q - 1} \left\{ \left| \mu(\sigma, x) - x \right|^{1 - \epsilon} + \left| \lambda^{\frac{1}{2} \gamma} (\sigma, x) - x \right|^{1 - \epsilon} + \\ & + \left| \eta^{\frac{1}{2} \gamma} (\sigma, x) - x \right|^{1 - \epsilon} \right\} \leq c_q \left[ f \right]_{D_A(\theta, \infty)} t^{1/2} \sigma^{-\epsilon}, \end{split}$$

and by Lemma 4.2(ii)

$$s_2 \leq c_q [f]_{D_A(\theta,\infty)} t^{-1/2} \sigma^{\epsilon};$$

on the other hand

$$s_3 \leq \int\limits_0^t \|\mathbf{u}'(s)\|_{\mathbf{C}^{q-1}(\overline{\Omega})} \, \mathrm{d} s \leq c_q \, t^{1/2} \, [\mathbf{f}]_{\mathbf{D}_{\mathbf{A}}(\theta,\infty)} \, ,$$

and finally

$$S_4 \leq c \|f\|_{C^{q-1}(\overline{\Omega})} \leq c \|f\|_{D_A(\theta,\infty)}.$$

Hence choosing  $t = (\frac{\sigma}{\sigma_0})^{2\epsilon}$  we get

$$\left[f\right]^{V_{d}^{B}(\underline{\Omega})} \leq c^{d} \left\|f\right\|^{D^{B}(\theta,\infty)}$$

and the proof is complete.

## 5. IMPROVEMENTS AND REMARKS.

By Theorems 3.1 and 4.1 the first equality of Theorem 2.4 is established. In order to check the second one, just a few remarks are needed. Concerning the first inclusion, repeating the argument of Section 3 we see that the right-hand sides of the inequalities of Proposition 3.2 have to be multiplied by o(1) (as  $s \nmid \infty$ ), due to the fact that f belongs to  $\lambda_{R}^{\mathbf{q}}(\overline{\Omega})$  now. Consequently we get

(5.1) 
$$\lim_{s \to \infty} s^{\theta} \| w(s) - f \|_{c} = 0,$$

which replaces (3.1). In order to get the analogous of (3.2), i.e.

(5.2) 
$$\lim_{s \uparrow \infty} s^{\theta} || AR(s,A)w(s)|| = 0,$$

it is readily seen that the main point is to show that if  $m_{\frac{1}{2}} \leq q$ 

$$\lim_{s \to \infty} s^{-\theta} \| \mathbf{B}_{\mathbf{j}}(\cdot, \mathbf{D}) \mathbf{w}(s) \|_{\mathbf{C}^{\mathbf{q}-\mathbf{m}} \mathbf{j}(\partial \Omega)} = 0.$$

This is easily proved, similarly to (3.17), when  ${\tt m}_j\!<\!\!q.$  In the case  ${\tt m}_j\!=\!\!q$  we split

$$B_{j}(x,D)w(s,x) = \overline{B}_{j}(x,D)w(s,x) + \hat{B}_{j}(x,D)[w(s,x)-f(x)] + \hat{B}_{j}(x,D)f(x);$$

but

$$\Big|\overset{\circ}{\mathbb{E}}_{j}^{(x,D)[w(s,x)-f(x)]}\Big| \leq c \|w(s)-f\| \\ c^{mj-1} \underbrace{(\overline{\Omega})}^{\leq c} q \Big[ \underbrace{f}_{\Lambda^{q}} \underbrace{(\overline{\Omega})}^{s^{-1}=o(1)} \text{ as } s + \infty,$$

whereas, using the notations of (3.19),

$$\begin{aligned} & \left| \overline{B}_{j}(x,D)w(s,x) + \overline{B}_{j}(x,D)f(x) \right| \leq T_{1} + T_{2} + \left| (\Delta_{\sigma}^{B_{j}}f)(x) + \overline{B}_{j}(x,D)f(x) \right| \leq \\ & \leq c_{q} \sigma s^{1/2m} o(1) + c_{q} \sigma^{-1} s^{-1/2m} o(1) + o(1) \quad \text{as} \quad s + +\infty, \end{aligned}$$

where in estimating the last term we have used the boundary condition satisfied by f. Taking  $\sigma:=\sigma_0^{-1/2m}$  we finally get (5.2), which together with (5.1) yields

$$\lim_{s \uparrow + \infty} s^{\theta} \| AR(s, A) f \|_{C(\Omega)} = 0,$$

i.e., by (1.11),  $f \in D_{\pi}(\theta)$ .

The second inclusion is easier: if  $f \in D_{A}(\theta)$ , then, as  $D_{A}(\theta)$  is the closure of  $D_{A}$  in  $D_{A}(\theta,\infty)$ , we take a sequence  $\{u_{n}\} \subset D_{A}$  such that  $u_{n} + f$ 

20

in  $D_{\underline{a}}(\theta, \infty)$ : then

$$\begin{cases} u_n \to f & \text{in } \Lambda^{\mathbf{q}}(\overline{\Omega}) \\ [u_n - f]_{\Lambda^{\mathbf{q}}_{\mathbf{q}}(\overline{\Omega})} \to 0 \end{cases}$$

The first condition implies  $f \in \lambda^q(\overline{\Omega})$  since  $D \hookrightarrow \lambda^q(\overline{\Omega})$  and  $\lambda^q(\overline{\Omega})$  is a closed subspace of  $\Lambda^q(\overline{\Omega})$ ; the second one easily yields (since  $B_j(\cdot,D)u_n=0$  for  $j=1,\ldots,m$ ):

$$\lim_{\sigma \downarrow 0} (\Delta_{\sigma}^{B_{j}} f)(x) = -B_{j}^{o}(x,D) f(x)$$

provided  $x\in\partial\Omega$  and m=q. Thus  $f\in\lambda_B^{Q}(\overline{\Omega})$  and Theorem 2.4 is completely proved.

REMARK 5.1. Theorem 2.4 still holds in the case of elliptic systems in a possibly unbounded open set which is uniformly regular of class  $c^{2m}$  [Amann, 1984; Geymonat-Grisvard, 1967] (compare with [Acquista-pace-Terreni,1987, Remark 5.1]).

REMARK 5.2. Theorem 2.4 in the case m=1 was proved, with different techniques, in [Acquistapace-Terreni, 1984].

REMARK 5.3. In the definition (2.13) of  $\Delta_{\sigma}^{B_{j}}f$  we may replace the integral curve  $\mu(\sigma,x)$  of (2.10) by the segment  $x-\sigma v(x)$ ,  $\sigma \in [0,\sigma_{0}]$ . Indeed, if  $f \in \Lambda^{Q}(\overline{\Omega})$  we have (denoting by  $u(t,\cdot)$  the function satisfying (2.5) and such that  $u(0,\cdot)=f$ :

$$\begin{split} & \Big| \frac{D^{\beta} f(\mu(\sigma, \mathbf{x})) - D^{\beta} f(\mathbf{x})}{\sigma} - \frac{D^{\beta} f(\mathbf{x} - \sigma \nu(\mathbf{x})) - D^{\beta} f(\mathbf{x})}{\sigma} \Big| = \\ & = \Big| - \frac{1}{\sigma} \int_{0}^{t} \Big[ D^{\beta} \mathbf{u}_{\mathbf{s}}(\mathbf{s}, \mu(\sigma, \mathbf{x})) - D^{\beta} \mathbf{u}_{\mathbf{s}}(\mathbf{s}, \mathbf{x} - \sigma \nu(\mathbf{x})) \Big] \, d\mathbf{s} + \\ & + \frac{1}{\sigma} \int_{0}^{\sigma} \Big[ (\nabla D^{\beta} \mathbf{u}(\mathbf{t}, \mu(\rho, \mathbf{x})) \big| \nabla d(\mu(\rho, \mathbf{x}))) + (\nabla D^{\beta} \mathbf{u}(\mathbf{t}, \mathbf{x} - \rho \nu(\mathbf{x})) \big| \nu(\mathbf{x})) \Big] \, d\rho \Big| \leq \end{split}$$

$$\leq c \sigma^{-1} t^{1/2} \|f\| \int_{\Lambda^{\mathbf{q}}(\overline{\Omega})} |\mu(\sigma, \mathbf{x}) - \mathbf{x} + \sigma \mathbf{v}(\mathbf{x})|^{1-\varepsilon} +$$

$$+ c \sigma^{-1} t^{-1/2} \|f\| \int_{\Lambda^{\mathbf{q}}(\overline{\Omega})} |\sigma| \left[ |\mu(\rho, \mathbf{x}) - \mathbf{x} + \rho \mathbf{v}(\mathbf{x})|^{\varepsilon} + |\mu(\rho, \mathbf{x}) - \mathbf{x}| \right] d\rho \leq$$

$$\leq c \|f\| \int_{\Lambda^{\mathbf{q}}(\overline{\Omega})} \{ t^{1/2} \sigma^{-\varepsilon} \circ (1) + t^{-1/2} \sigma^{\varepsilon} \circ (1) \} \leq o(1) \quad \text{as} \quad \sigma \nmid 0$$

$$\text{provided we choose} \quad t = (\frac{\sigma}{\sigma_0})^{2\varepsilon}.$$
